

BRACES on demand

MONOLITHIC

DIRECT BOND, INDIRECTLY

Monolithic is a fully custom, patient-specific bracket system that features an integrated occlusal registration for precise placement.

- Greater access to the bracket pad without the risk of adhesive or primer sticking to a tray.
- As with direct bonding, brackets can be fully seated against the tooth, expressing any excess adhesive, and allowing for flash removal.
- Easily inspect for proper bracket positioning prior to curing.
- Light cure multiple points of the bracket with no tray material to penetrate.
- It's a snap to remove the occlusal registration jig and supports—NO TRAYS TO REMOVE!
- 3D print a fully custom, patient-specific appliance in as little as 24 hours from approval on a Formlabs Form 3B or order for delivery.
- When printing in office, replacement brackets can be printed as needed, when needed. No need to contact BOD or wait for brackets to be produced and shipped to your office.
